

Sun behind cloud

The mark is the parent of the in-app icon family, drawn one weight bolder: a full sun disc with eight stubby rays, sitting behind a single three-lobe cloud that anchors the lower half. The sun is pushed off-centre to the upper left so the silhouette is asymmetric — that is what separates it at a glance from the stock Android and Google Weather marks, which centre their sun. Fixed colours: sun body #FFCA28, rays #FFB300, cloud #FFFFFF (white rather than the in-app #546E7A, which would sink into the background). The background layer is the brand gradient unchanged: #1565C0 → #00707C, vertical, full bleed.

How the monochrome layer flattens

One path, one fill, non-zero winding: the disc and the cloud merge into a single solid mass and only the rays break the outline. That is deliberate — nothing relies on colour separation, and there are no details thinner than 6.5dp, so it survives system tinting at 48dp and below. Ray tips stay 4dp clear of the cloud edge everywhere.
